

aMail Signs VAR Agreement with AXSionics AG, to Become Global AXSionics partner.

Ottawa, Ontario – May 25, 2008 – aMail Inc. (aMail) announced the completion of the visit to Ottawa of Alain Rollier the CEO of AXSionics AG (AXS) of Switzerland. During the visit Mr Rollier met with a-Mail personnel, directors and potential customers. With the signing of a VAR agreement with AXSionics AG, in July 2008, aMail become an AXS Value Added Reseller (VAR) of AXS's disruptive, privacy enhanced, microprocessor based, smartcard technology that provides secure identity-verified access to Internet web portals to conduct sensitive transactions.

"The continuing shift to electronic medical records has increased risks to the safety of patient medical records." "the privacy and the security of patient data, plus increasing risks of medical identity theft are critical problems looking for solutions," said Sal Khan, CEO of aMail. Similarly, secure identity-verified, end-to-end secure access to online bank accounts to transfer funds, and pay bills, is another area where the AXSionics smartcard called FlickerCard™ in North America, can play a major role in preventing the hijacking of bank accounts and minimizing the theft of an online banker's identity.

FlickerCard™ is a "*personal identity credential*" which uses on-card embedded fingerprint technology with a unique match-on-card system, to verify the identity of its owner. Since the fingerprint template is stored onboard FlickerCard™, a central biometric database is not required, alleviating privacy concerns. Internally FlickerCard™ contains 112 digital security credentials which provide secure identity-verified access to 112 different online access points.

As a Value Added Reseller of the AXSionics products, aMail will be able to support the North American health care and financial markets in meeting their goals to provide secure identity-verified access to electronic health records and online financial transactions.

aMail plans to integrate FlickerCard™ with its product a-Mail™ which is currently under development. a-Mail™, a patented solution uses strong encryption and biometric identification technology to send and receive secure identity-verified electronic mail. "ASXsionics is looking forward to the integration of FlickerCard™ and a-Mail™, said Alain Rollier, CEO of AXSionics, "we expect to cross-license a-Mail™ when it is completed, and plan to offer it to our customer and other AXSionics resellers."

About aMail Inc.

aMail Inc. is a private Canadian company that is developing patented secure electronic mail software that will allow a user to send and receive secure, encrypted and identity-verified email. aMail products also utilize biometric identity-verified login for remote access to Internet portals, computers and computer networks to replace passwords and tokens.
